

# **Renewable Energy Transmission Initiative Phase 1B Update**

**Black & Veatch**

**Stakeholder Steering Committee**

**July 16, 2008**

## Agenda

- Phase 1B Work Group Items
  - Project Identification and Characterization
  - CREZ Identification
  - Transmission Methodology
- Draft Exclusion Maps

## Phase 1B Work Group Issues

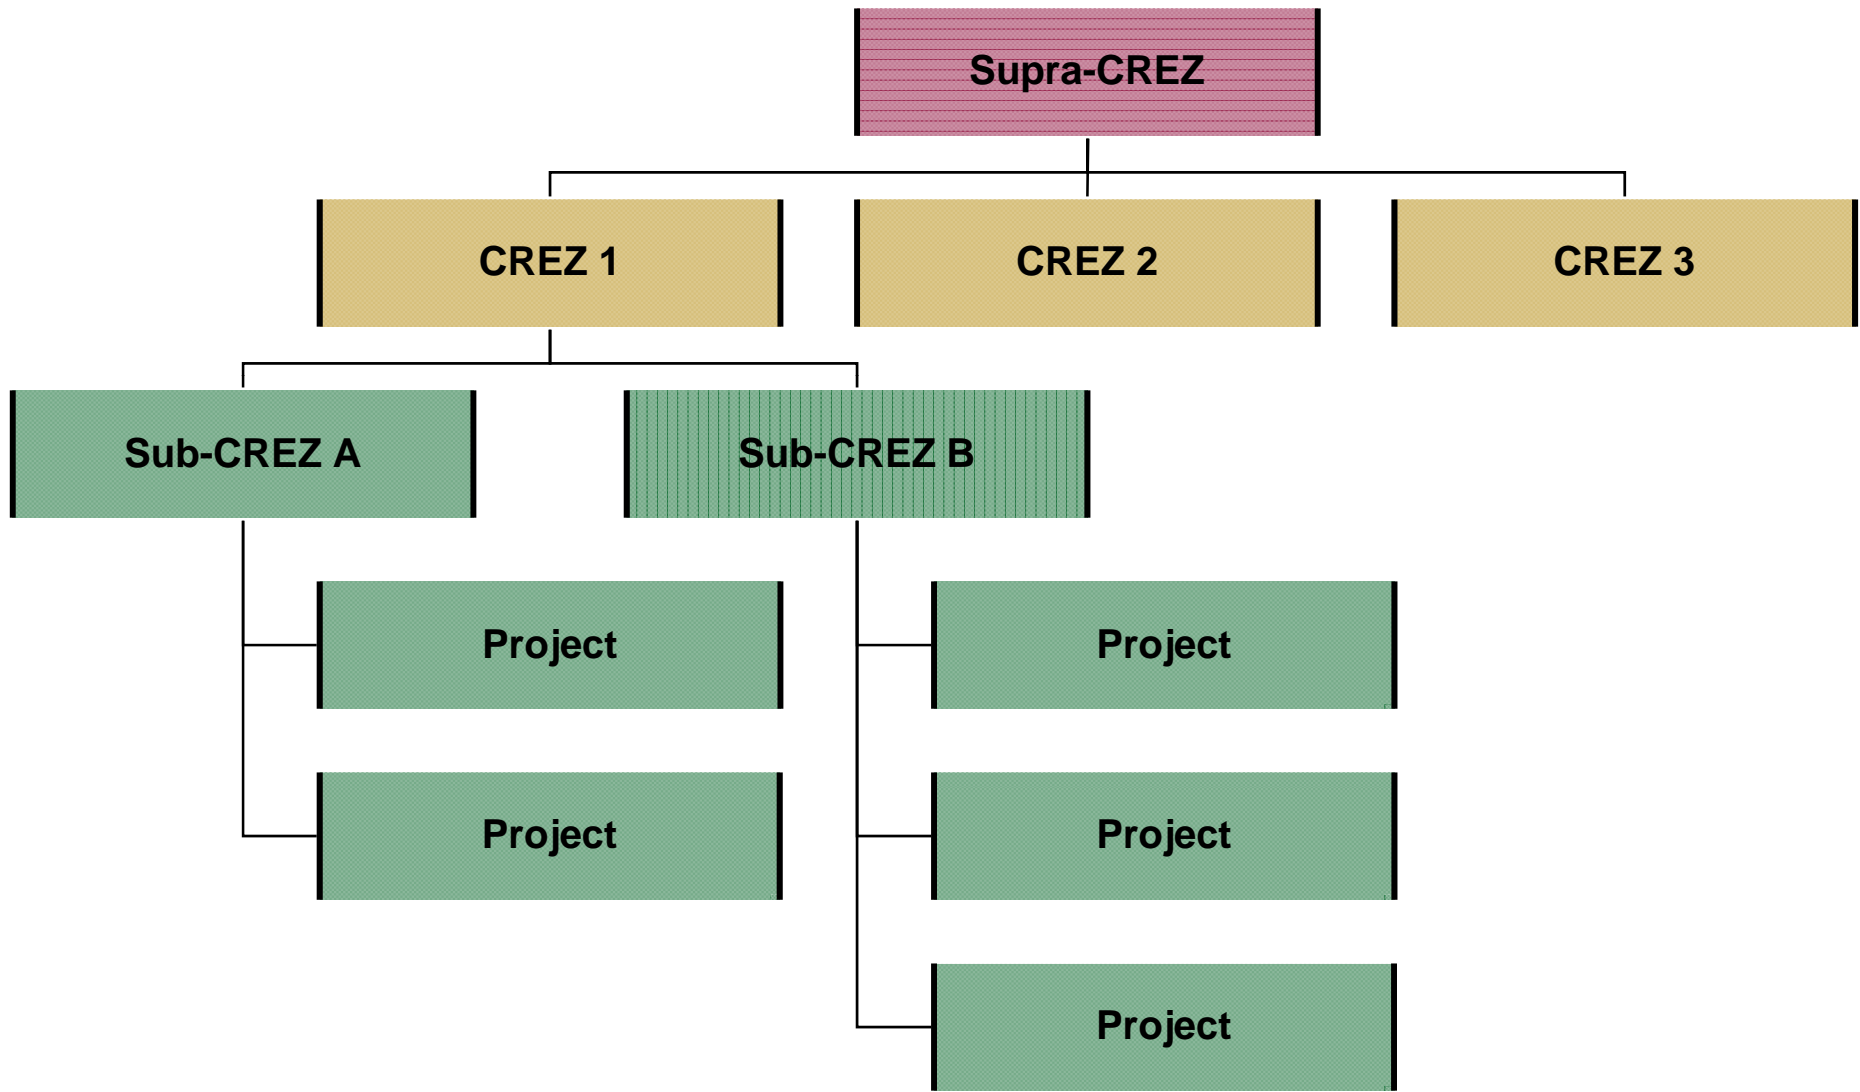

- Energy price forecast –reference and sensitivities
- Net short calculation
- Resource valuation model review
- Transmission assumptions
- Project characterization & identification
- Uncertainty assumptions - cost and CF data by resource type
- Advise on sensitivity analyses and data

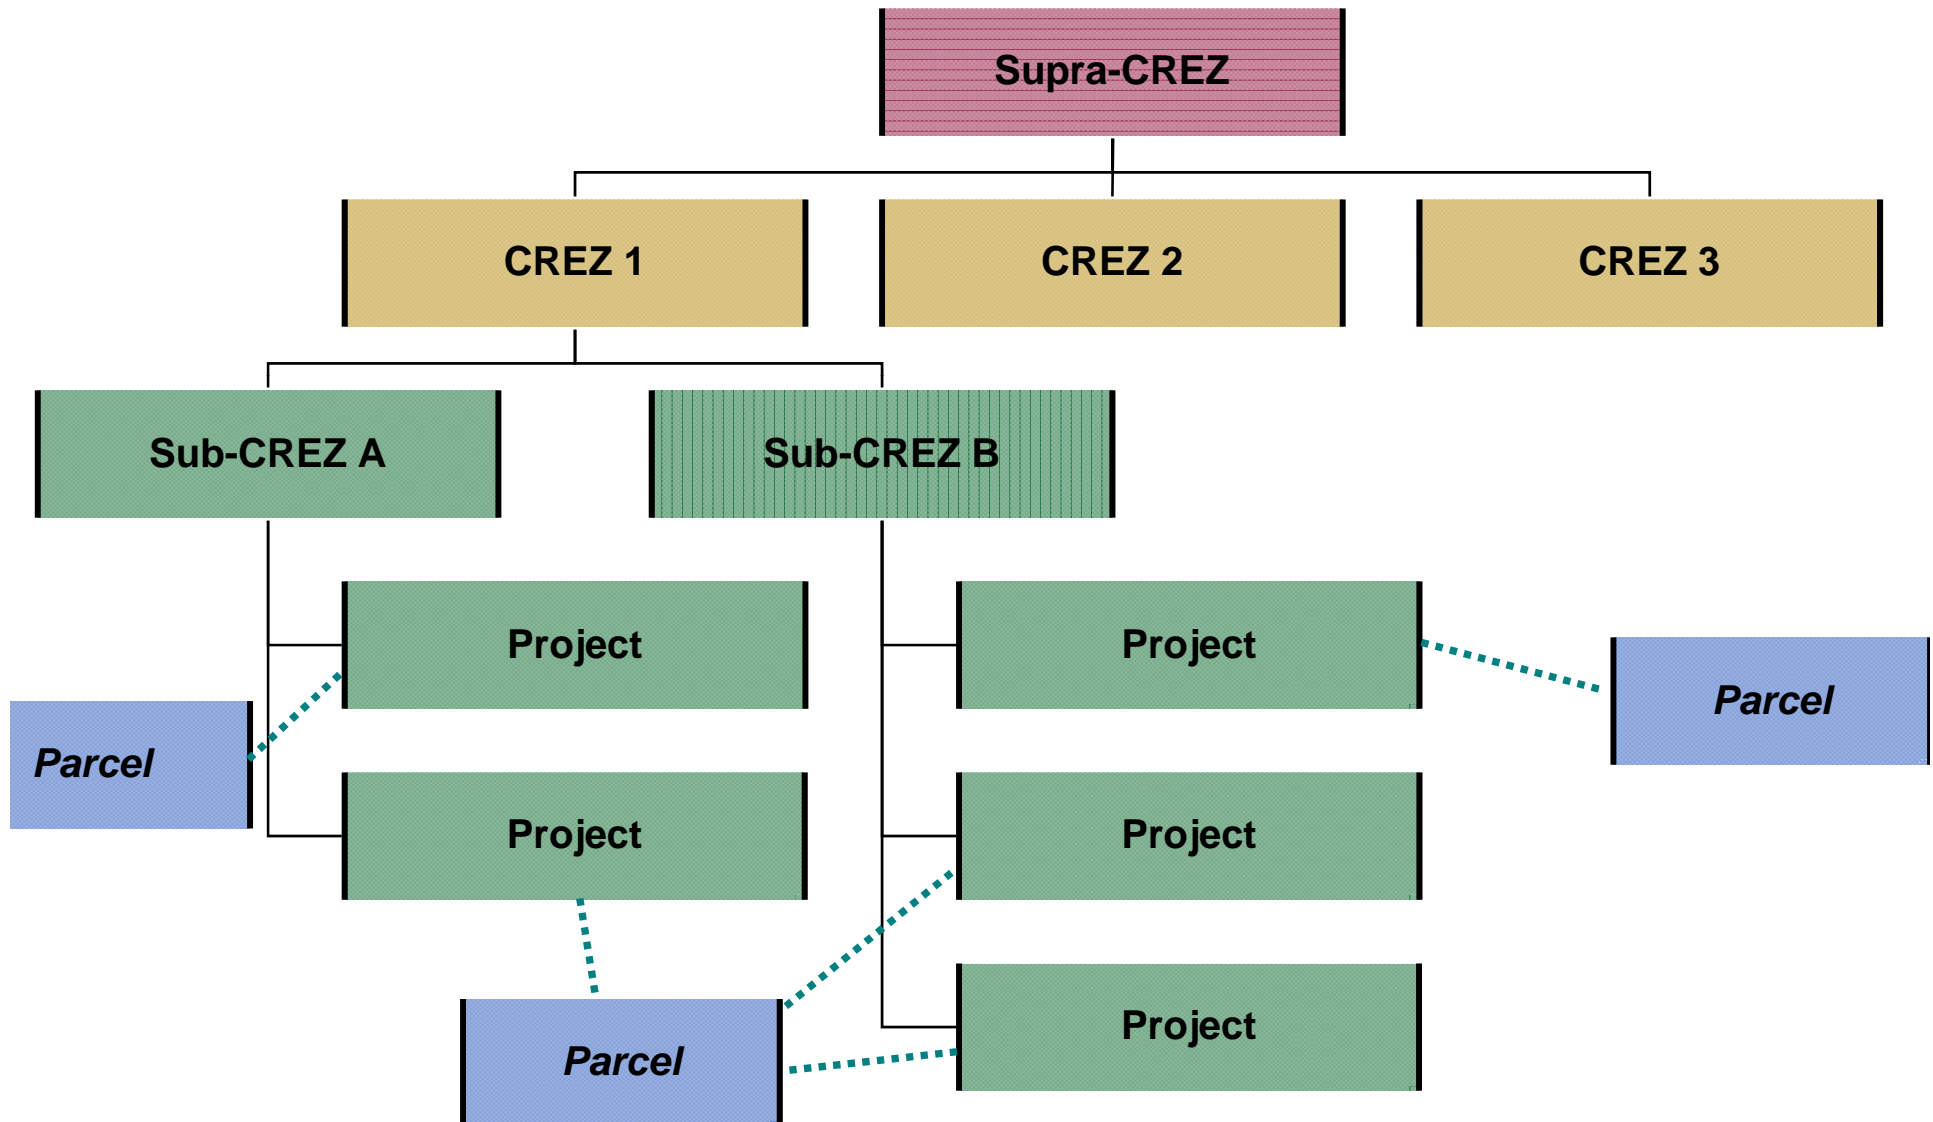

TBD

TBD

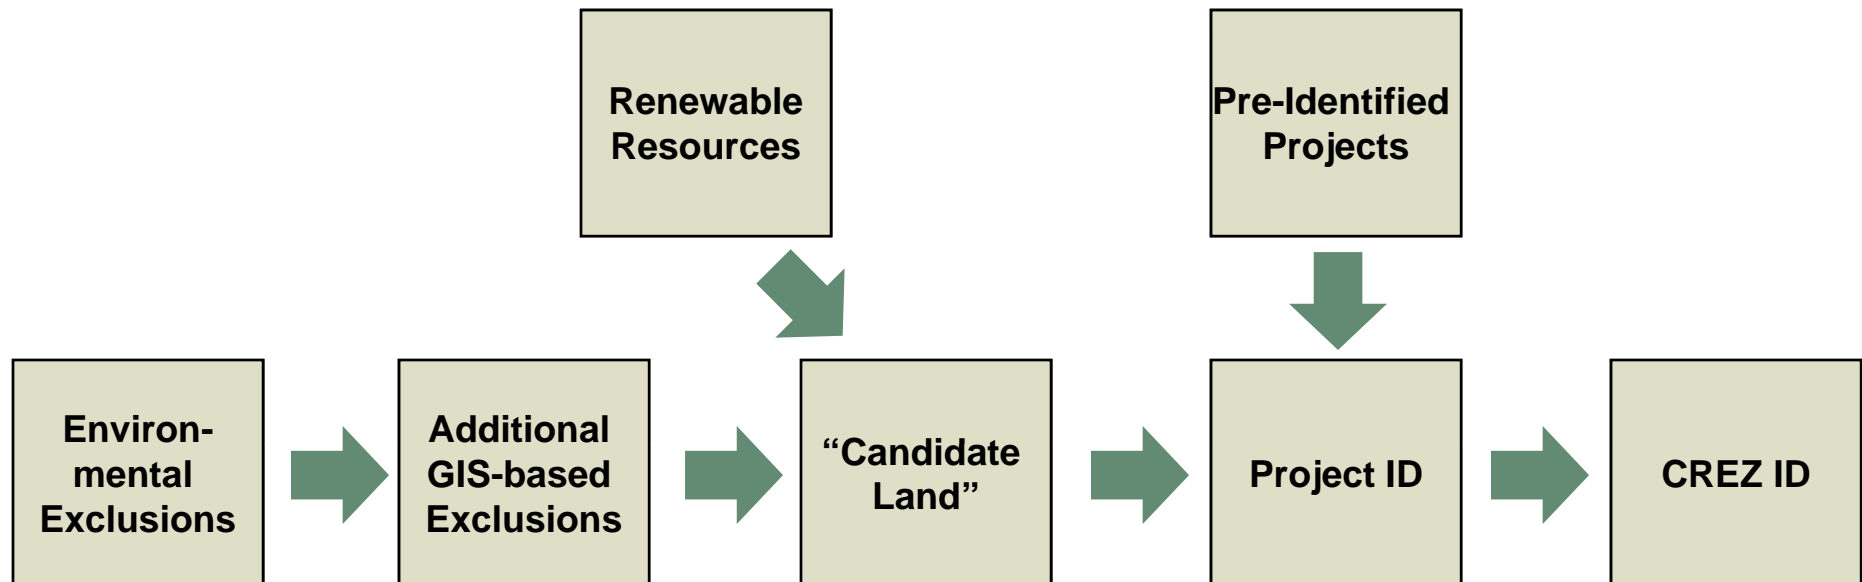

# RETI “Crezology”

# RETI “Crezology”

# Generalized Project / CREZ Identification Process (Applies to almost everything)

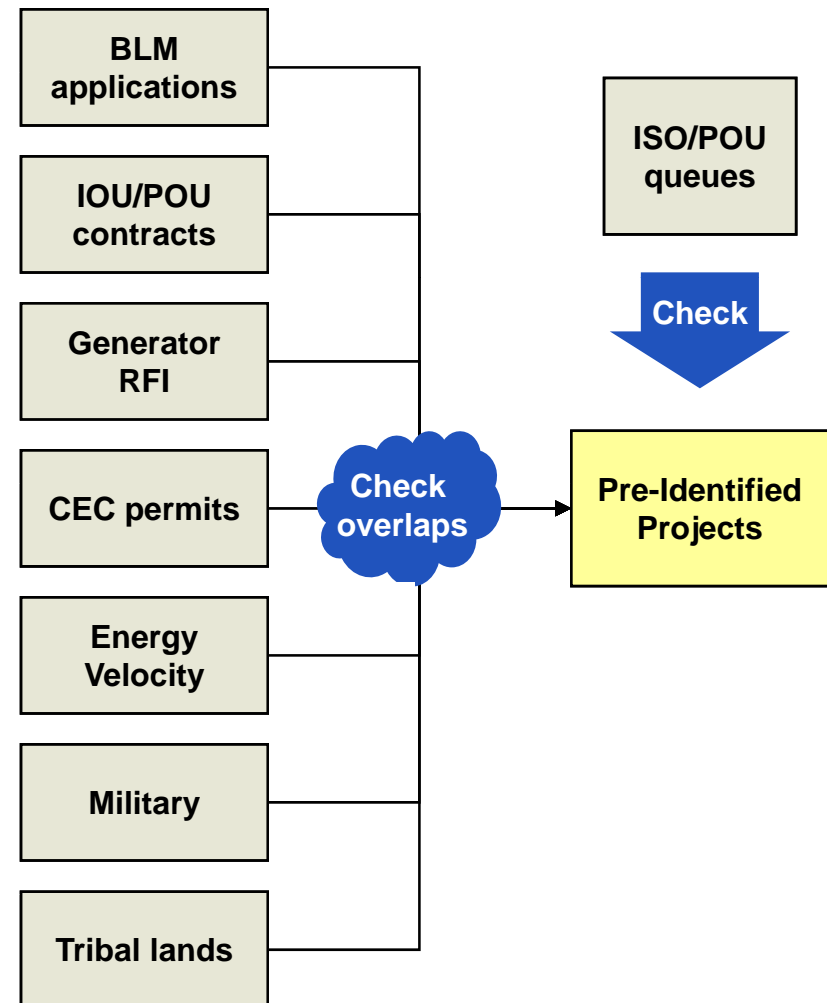

# Project Identification and Characterization

## *Generation Projects*

- **Pre-Identified Projects** – Areas/regions with some commercial interest or designation
  - Allows placement in otherwise restricted areas
  - Potential timing advantage
- **Proxy Projects** – All other projects identified by Black & Veatch
  - Avoid restricted areas
  - Default timing assumptions

## Pre-Identified Projects: Sources

- Collect project data
  - BLM applications, IOU/POU contracts, Generator RFI, CEC Permits, Energy Velocity, Military, Tribal
  - Check for overlaps
- Check against ISO/POU queues by county
  - Projects should exceed ISO/POU queue totals for each county
  - Gaps will be filled with proxy projects

## Pre-Identified Projects: No Capacity Information

- Some projects have land parcel information, with no capacity
  - For example, BLM wind applications with no capacity information
- B&V will fill the land parcel
  - Follow the proxy project methodology within the land parcel

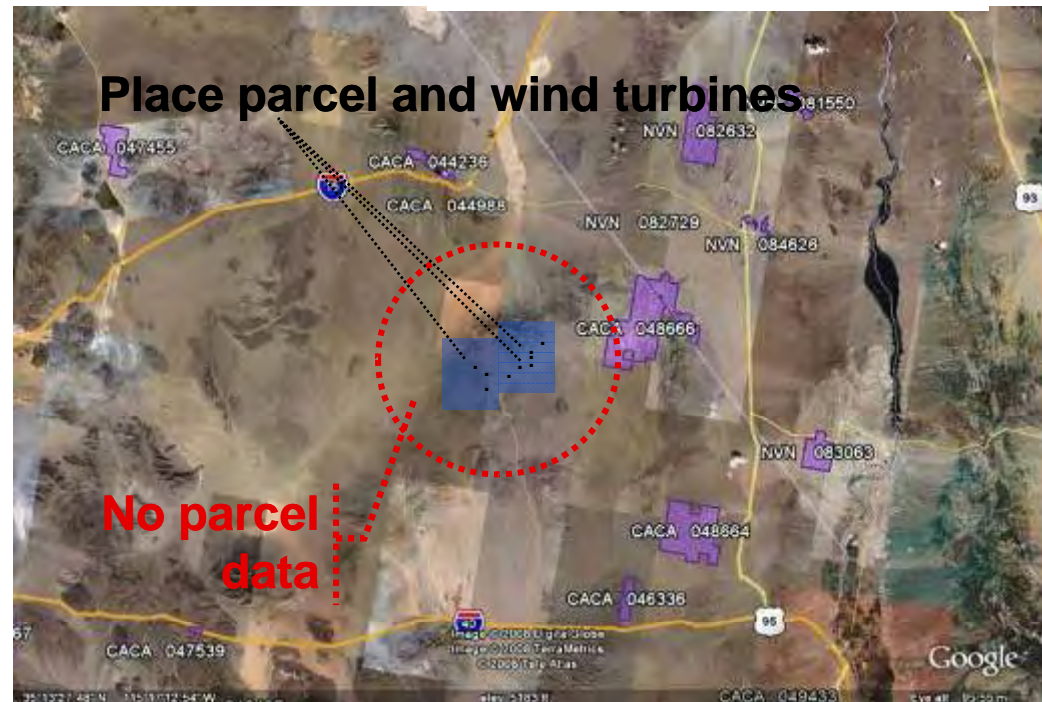

### Example Pre-identified Project Without Capacity Information

## Pre-Identified Projects: No Parcel Information

- Some projects have no land parcel information
  - For example, IOU contracts with county and capacity information but no specific location
- B&V will place the project in the county
  - Follow the proxy project methodology within the county area

### Example Pre-identified Project Without Parcel Information

## Pre-Identified Projects: Generator Responses

### Responses to the Generator Request For Information

- 18 responses to the Generator RFI
- 66 projects newly identified or verified
  - 21,497 total MW

|               | Wind       | Solar      | Geothermal | Biomass |
|---------------|------------|------------|------------|---------|
| # of projects | 35         | 15         | 15         | 1       |
| Locations     | CA, NV, OR | AZ, CA, NV | CA, NV     | CA      |
| MW            | 11,421     | 8,092      | 1,973      | 11      |

**Thank You to All That Have Responded!!!**

# Generation Project Characteristics

- Location
- Net plant output
- Capital costs
- Fixed operation and maintenance
- Variable operation and maintenance
- Heat rate (if applicable)
- Fuel costs (if applicable)
- Capacity factor
- Generation profile
- Land use
- Water use
- Where possible, identification of the affected sensitive species, such as bird and bat populations, or endangered species (this will be done based on GIS-information developed by the Environmental Working Group and the proposed project location)
- Air emissions

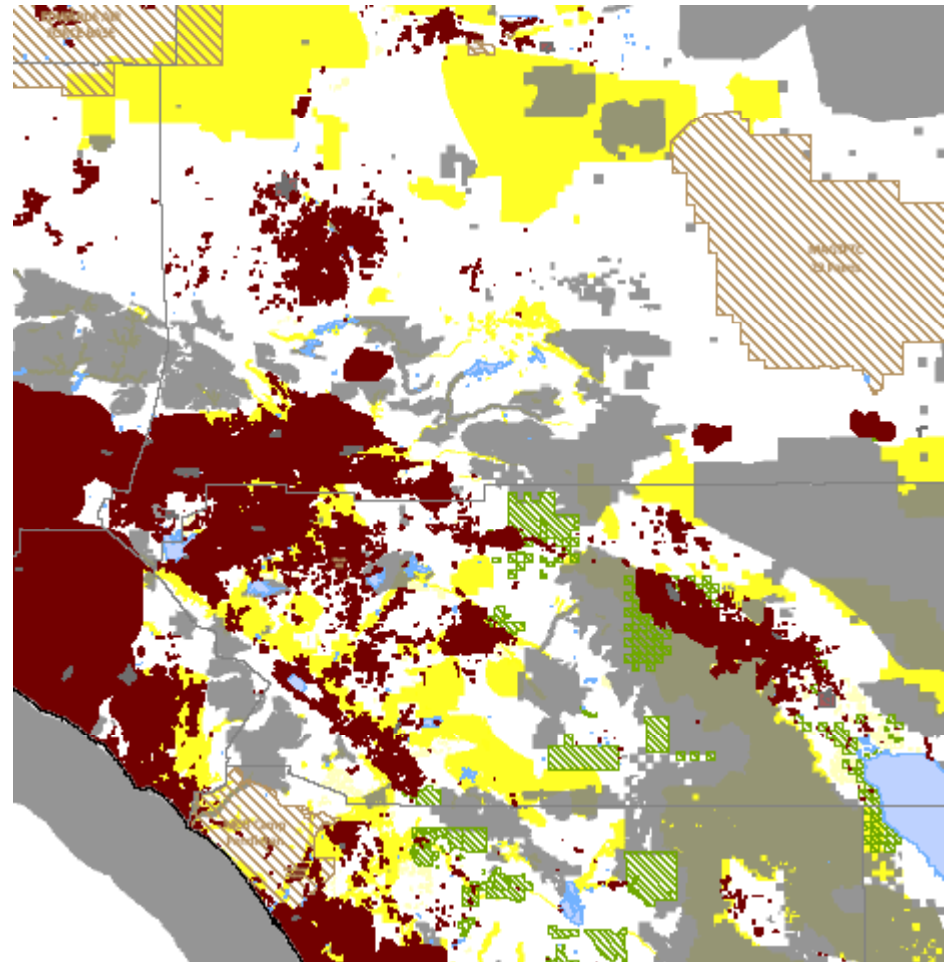

# Common Resource Exclusions

(Biomass projects separately considered)

|  | Solar Thermal | Solar PV     | Wind         | Geo-thermal  | Actions  |
|--|---------------|--------------|--------------|--------------|--|
| Environmental black-out areas          | Yes           | Yes          | Yes          | Yes          |  |
| Environmental yellow areas             | Yes*          | Yes*         | Yes*         | Yes*         | *Pre-identified projects allowed                               |
| Urban areas                            | Yes, +buffer  | Yes, +buffer | Yes, +buffer | Yes, +buffer | buffer up to 3 miles depending on population                   |
| Airports                               | Yes           | Yes          | Yes, +5 mi   | Yes          | Major airports only  |
| Wetlands and water bodies              | Yes           | Yes          | Yes          | Yes          | Dry lakes not excluded   |
| Min. contiguous acreage                | 640           | 160          | none         | none         | 640 acres = 1 section  |
| Land slope                             | < 2%          | < 5%         | none         | none         | Geothermal and wind to be evaluated on case by case basis      |
| Native American reservations           | Yes*          | Yes*         | Yes*         | Yes*         | *Pre-identified projects allowed                               |
| Military lands                         | Yes*          | Yes*         | Yes*         | Yes*         | *Pre-identified projects allowed                               |
| Mines (surface)                        | Yes           | Yes          | Yes          | Yes          |  |
| Military flyways / radar               | No            | No           | Yes* (Red)   | No           | *Pre-identified projects allowed in red zones. All other open. |
| Williamson Act Prime Agricultural land | Yes*          | Yes*         | No           | No           | *Pre-identified projects allowed                               |

## Resource Exclusions

- Base map distributed >
- Supplemental maps for each resource
  - Military flyway / radar
  - Williamson Act

# List of Screened Resources

|                    | CA  | OR  | WA   | NV  | AZ  | Baja California   | British Columbia  |
|--------------------|---|---|--|---|---|---|---|
| Solid Biomass      |    |    |   |   |   |   |    |
| Solar Photovoltaic |    |   |  |   |   |   |   |
| Solar Thermal      |    |   |  | <br>(south)  | <br>(west) |   |   |
| Onshore Wind       |   |   |  | <br>(south) |   | <br>(north) |   |
| Geothermal         |  |  |  |            |   |   |  |

## Project Identification and Characterization – Solar Thermal

### Proxy Projects

- Proxy projects will be developed in California as necessary to populate the analysis
  - Located on environmentally appropriate parcels

### Out of State Projects

- Parcels with known commercial interest will be used to model projects in NV and AZ
- Import limitation is 2,500 MW in 2020

## Project Identification and Characterization – Solar Thermal

**All solar thermal projects will be modeled as a solar trough plant**

- No thermal storage
- Dry cooled by default, wet cooled only with available recycled water

### Capital Costs

Project capital cost may be adjusted for:

- Site topography which would result in increased earthmoving costs (slope dependent)
- Significant road construction required to access site
- Wet / dry cooling

## Solar Thermal – Wet vs. Dry Cooling

- Cooling type will be based on availability of recycled water (treated municipal waste water)
- If recycled water available, use wet cooling
- All other plants assumed to be dry cooled
- Wet / dry not recommended as uncertainty issue
- Potential for lower water use with alternative / future technology to be noted

# Project Identification and Characterization – Solar Thermal

## Plant Performance

Performance characteristics will be calculated by NREL's Solar Advisor Model (SAM)

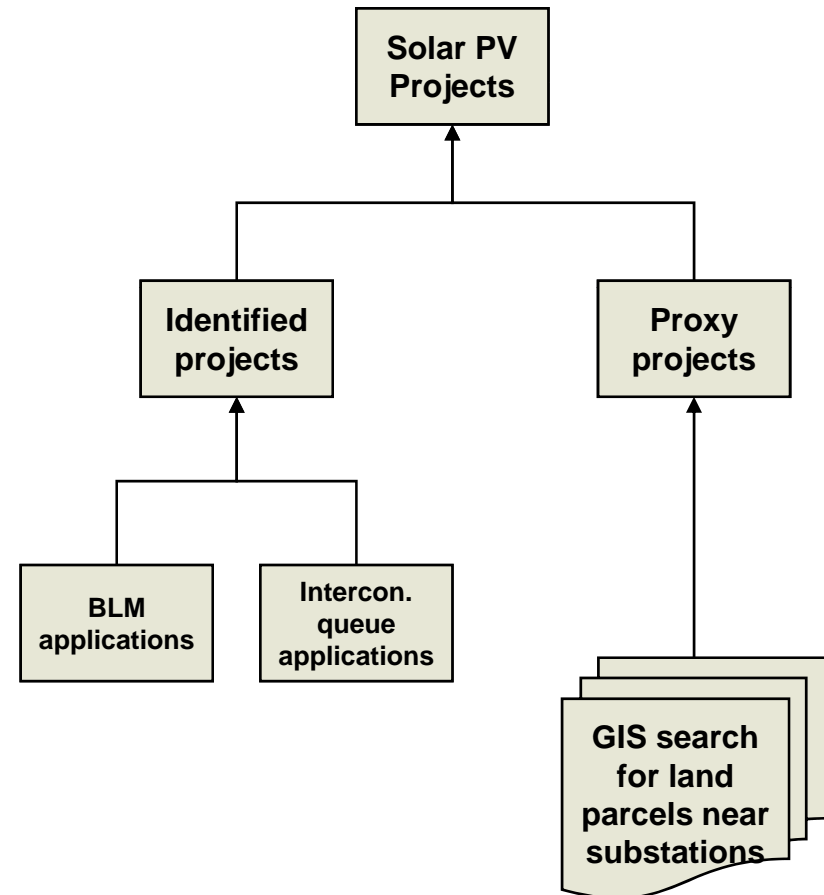

- Capacity factor and production profile
- Insolation and meteorological data from satellite-derived data in the National Solar Radiation Database (NSRDB)
- Enough SAM simulations will be performed to capture climate effects on performance.
  - Where simulations are not performed for a project's specific site, the performance characteristics of a nearby performance run will be scaled based on the difference in monthly average insolation and latitude.

# Project Identification and Characterization

## Solar Photovoltaic

- Identify solar PV projects from existing data sources
  - BLM applications
  - Interconnection queue applications
  - Generators and other sources
- Create proxy projects using GIS analysis
  - Agricultural or barren land
  - Excluding environmentally sensitive areas

# Project Identification and Characterization – Solar Photovoltaic Proxy Projects

## Example Map for Solar PV Proxy Projects

### Proxy Projects

- Initial criteria
  - Non-prime agricultural or barren land
  - less than 5% slope

# Project Identification and Characterization – Solar Photovoltaic

## Example Map for Solar PV Proxy Projects

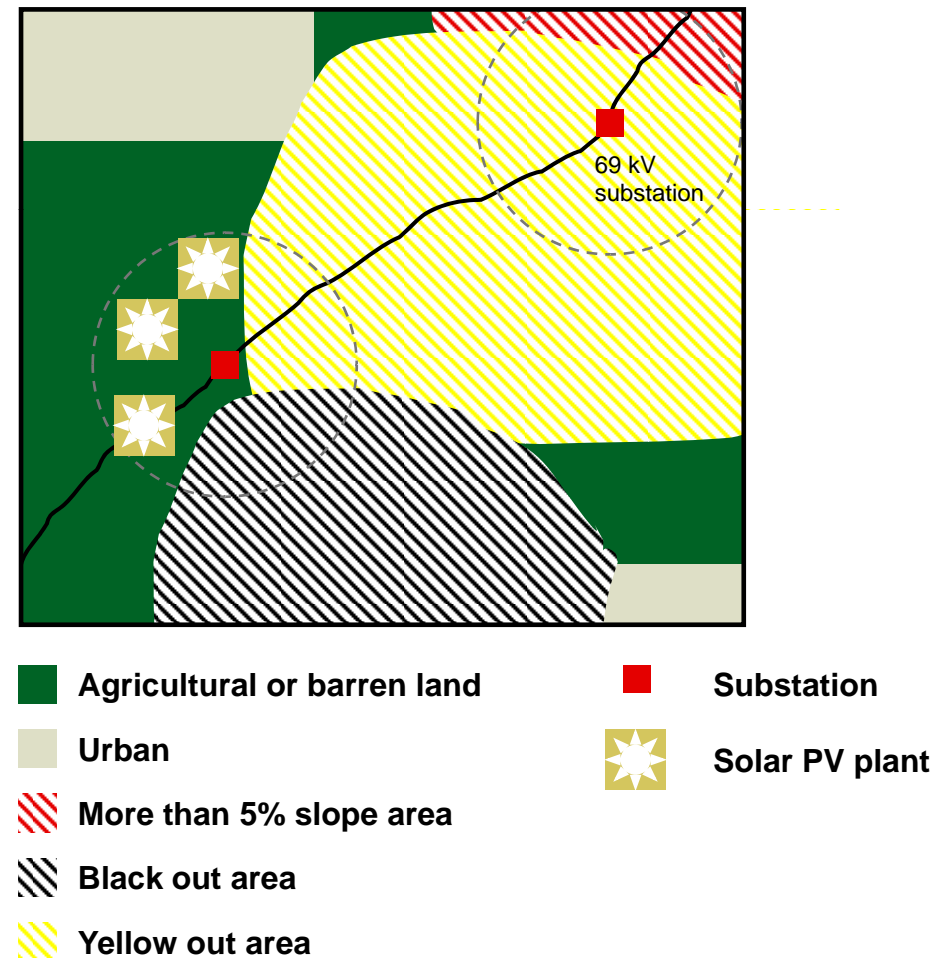

- Initial criteria
  - Non-prime agricultural or barren land
  - less than 5% slope
- Environmental screen
  - Black out areas
  - Yellow out areas

# Project Identification and Characterization – Solar Photovoltaic

- Initial criteria
  - Non-prime agricultural or barren land
  - less than 5% slope
- Environmental screen
  - Black out areas
  - Yellow out areas
- Land parcels
  - Continuous 160 acre plots
  - As close to substation as possible

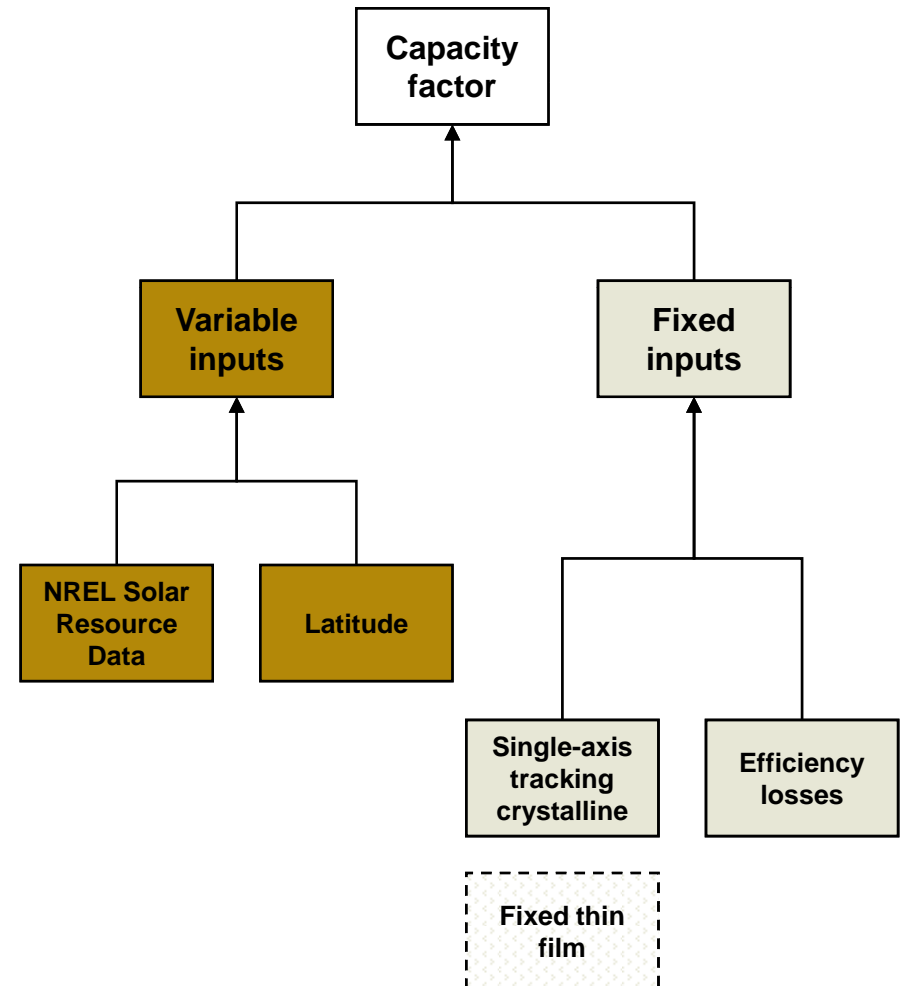

Example Map for Solar PV Proxy Projects

# Project Identification and Characterization – Solar Photovoltaic

## Capacity Factor

- Variable inputs
  - High resolution NREL GIS solar data with monthly averages
  - Latitude for determining path of the sun
- Fixed inputs
  - Technology assumption
    - Base case: Single axis tracking crystalline
    - Sensitivity case: Fixed thin film
  - Efficiency losses to include soiling, inverter, wiring and other loss mechanisms

# Project Identification and Characterization – Solar Photovoltaic

## Production profile

- 12 x 24
  - Typical 24 hour production profile for each month
- Production profile variation drivers
  - Month of year
  - Latitude
  - Single axis vs. fixed tilt
  - Temperature (minor)

**Example solar PV production profile  
single axis tracking (winter)**

**CONCEPTUAL – FOR EXAMPLE ONLY**

## Wind Projects - Siting

### Proxy Projects

- Based on available land not identified or connected with other project data
- Meet requirements for wind resource, terrain, environmental sensitivity, military restrictions, etc.
- Best projects selected first

### Out of State Projects

- Out-of-state projects will be modeled by wind class, considering competing demand and a discount for “developability”
- Subject to import limitations

## Wind Projects - Characterization

### Capital Costs

- Reference balance of plant construction costs developed for several types of project sites
  - Flat terrain, several rows of turbines
  - Intermediate terrain types
  - Mountainous terrain, turbines on ridgeline
- Wind turbine price assumed to be uniform for all project types
- Cost adjustment for distance of site from major roads and highways

# Wind Projects - Characterization

## Plant Performance

Performance characteristics will be based on the California speed wind map

- Capacity determined by amount of land (sq. mi.) available at each wind speed
- Capacity factor calculated based on California wind maps (adjusted to 80-m hub height)
- General wind turbine power curves used
  - Representative power curves for IEC design classes (I, II, and III)
  - Adjustment of power curves based on average temperature in area and project site elevation
- Losses applied, wake losses based on terrain type and project size
- Production profile by region from wind map

## Biomass Projects - Siting

### Proxy Projects

- California Biomass Collaborative 2010 technically feasible capacity by county as basis for supply
  - Breakdown by agricultural residues, forest residues, and urban wood waste; subdivisions in each
- Determined maximum potential MW from supply using 80% capacity factor and 13,650 BTU/kWh heat rate
  - Reduced by assuming 1/3<sup>rd</sup> of maximum supply available for power generation (remainder for other purposes or potentially too expensive)
  - Minimum project size set at 20 MW for economic feasibility

## Biomass Projects - Siting

### Proxy Projects

- Determined if specific subtypes of biomass could meet 20 MW threshold; if not, grouped together
  - Example: Vegetable crop subtype of agriculture
- If none of the three major types of biomass within a county can meet the 20 MW threshold, group together in a multi-fuel plant
  - Urban wood waste held separate due to properties
- Use remaining material to consider plants at county borders
- Assume siting near major county substations

## Biomass Project Examples (Single County)

| Project | County    | Generation Capacity (MW) | Biomass Fuel(s)                 |
|---------|-----------|--------------------------|---------------------------------|
| 1       | Butte     | 22                       | Composite Agricultural Residues |
| 2       | Colusa    | 23                       | Field/Seed Crop Residues        |
| 3       | El Dorado | 32                       | Composite Wood Residues         |
| 4       | Fresno    | 24                       | Field/Seed Crop Residues        |
| 5       | Fresno    | 22                       | Multifuel                       |
| 6       | Fresno    | 20                       | Orchard/Vineyard Residues       |
| 7       | Glenn     | 22                       | Composite Agricultural Residues |
| 8       | Humboldt  | 61                       | Forest Thinnings/Slash          |
| 9       | Kern      | 21                       | Field/Seed Crop Residues        |
| 10      | Kern      | 30                       | Multifuel                       |
| 11      | Kings     | 21                       | Field/Seed Crop Residues        |
| 12      | Lassen    | 39                       | Composite Wood Residues         |

## Biomass Project Examples (Multiple County)

| Project | Central County | Additional Counties                           | Generation Capacity (MW) | Biomass Fuel(s) |
|---------|----------------|---|--------------------------|-----------------|
| 6       |                | Amador, Calaveras                             | 24                       | Multifuel       |
| 7       |                | Yolo, Colusa                                  | 26                       | Multifuel       |
| 8       |                | Butte, Yuba                                   | 32                       | Multifuel       |
| 9       |                | Del Norte, Humboldt                           | 25                       | Multifuel       |
| 10      |                | San Diego, Imperial                           | 33                       | Multifuel       |
| 11      |                | San Bernadino, Riverside, LA                  | 28                       | Multifuel       |
| 12      |                | Inyo, Tulare                                  | 20                       | Multifuel       |
| 13      |                | Lake, Napa, Solano                            | 32                       | Multifuel       |
| 14      |                | Mendocino, Sonoma, Marin                      | 21                       | Multifuel       |
| 15      |                | Mariposa, Stanislaus                          | 24                       | Multifuel       |
| 16      |                | SLO, Santa Barbara, Ventura                   | 21                       | Multifuel       |
| 17      |                | Nevada, Sierra                                | 29                       | Multifuel       |
| 18      |                | Placer, Sacramento                            | 27                       | Multifuel       |
| 19      |                | Monterey, San Benito, Santa Cruz, Santa Clara | 24                       | Multifuel       |

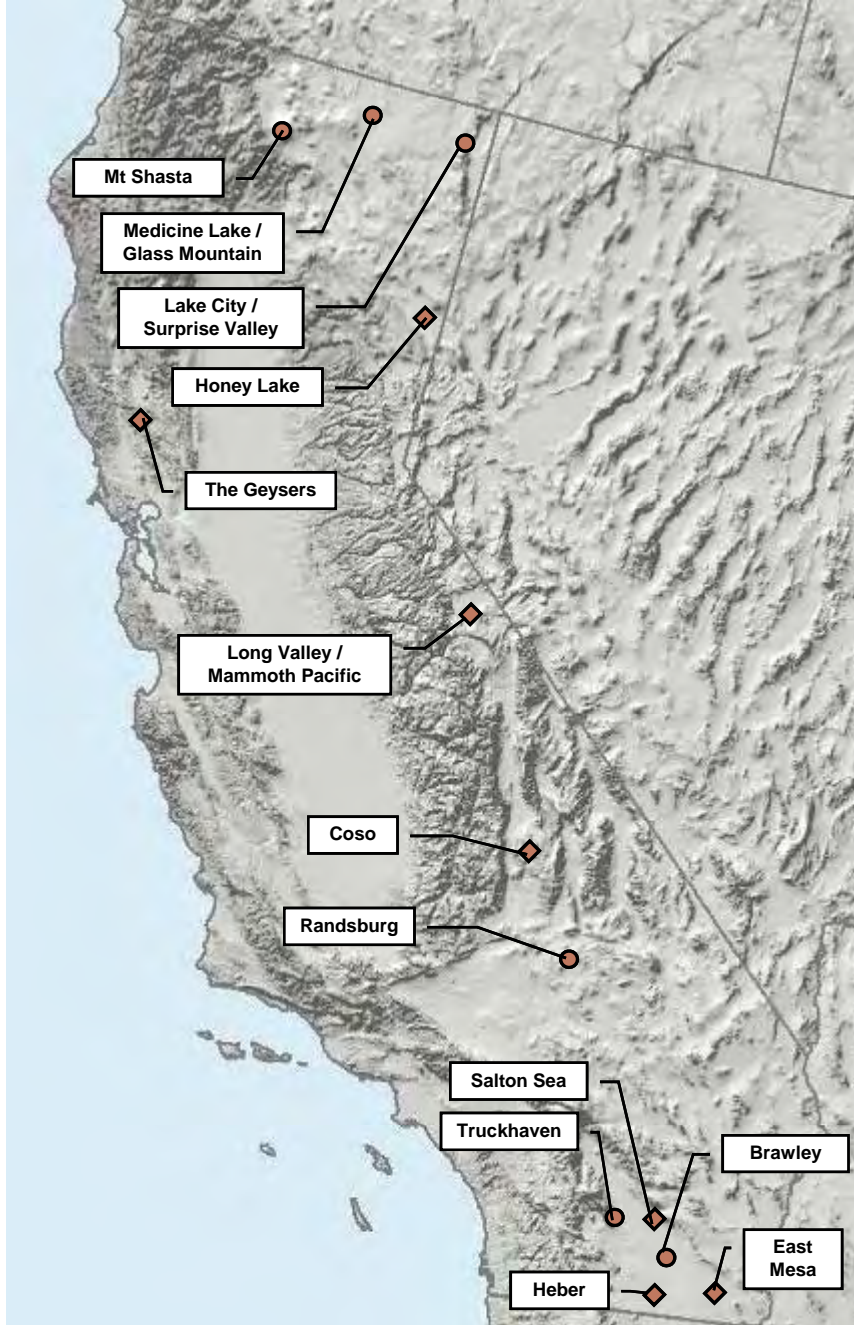

## Biomass Projects - Characterization

### Plant Performance

- Capital cost to be based on a \$/kW basis for biomass, function of scale and fuel type
- Operating cost largely driven by feedstock. Will set a cost per feedstock type, sensitive to any counties with remote sources
  - Cost of environmental credits evaluated per county. Has impacted siting (example: SCAQMD)
- Heat rate – function of fuel type (moisture content)

## Geothermal

- Geothermal assessment performed by GeothermEx
- California and Nevada estimates based on past GeothermEx work
- Estimates for other regions rely on multiple data sources

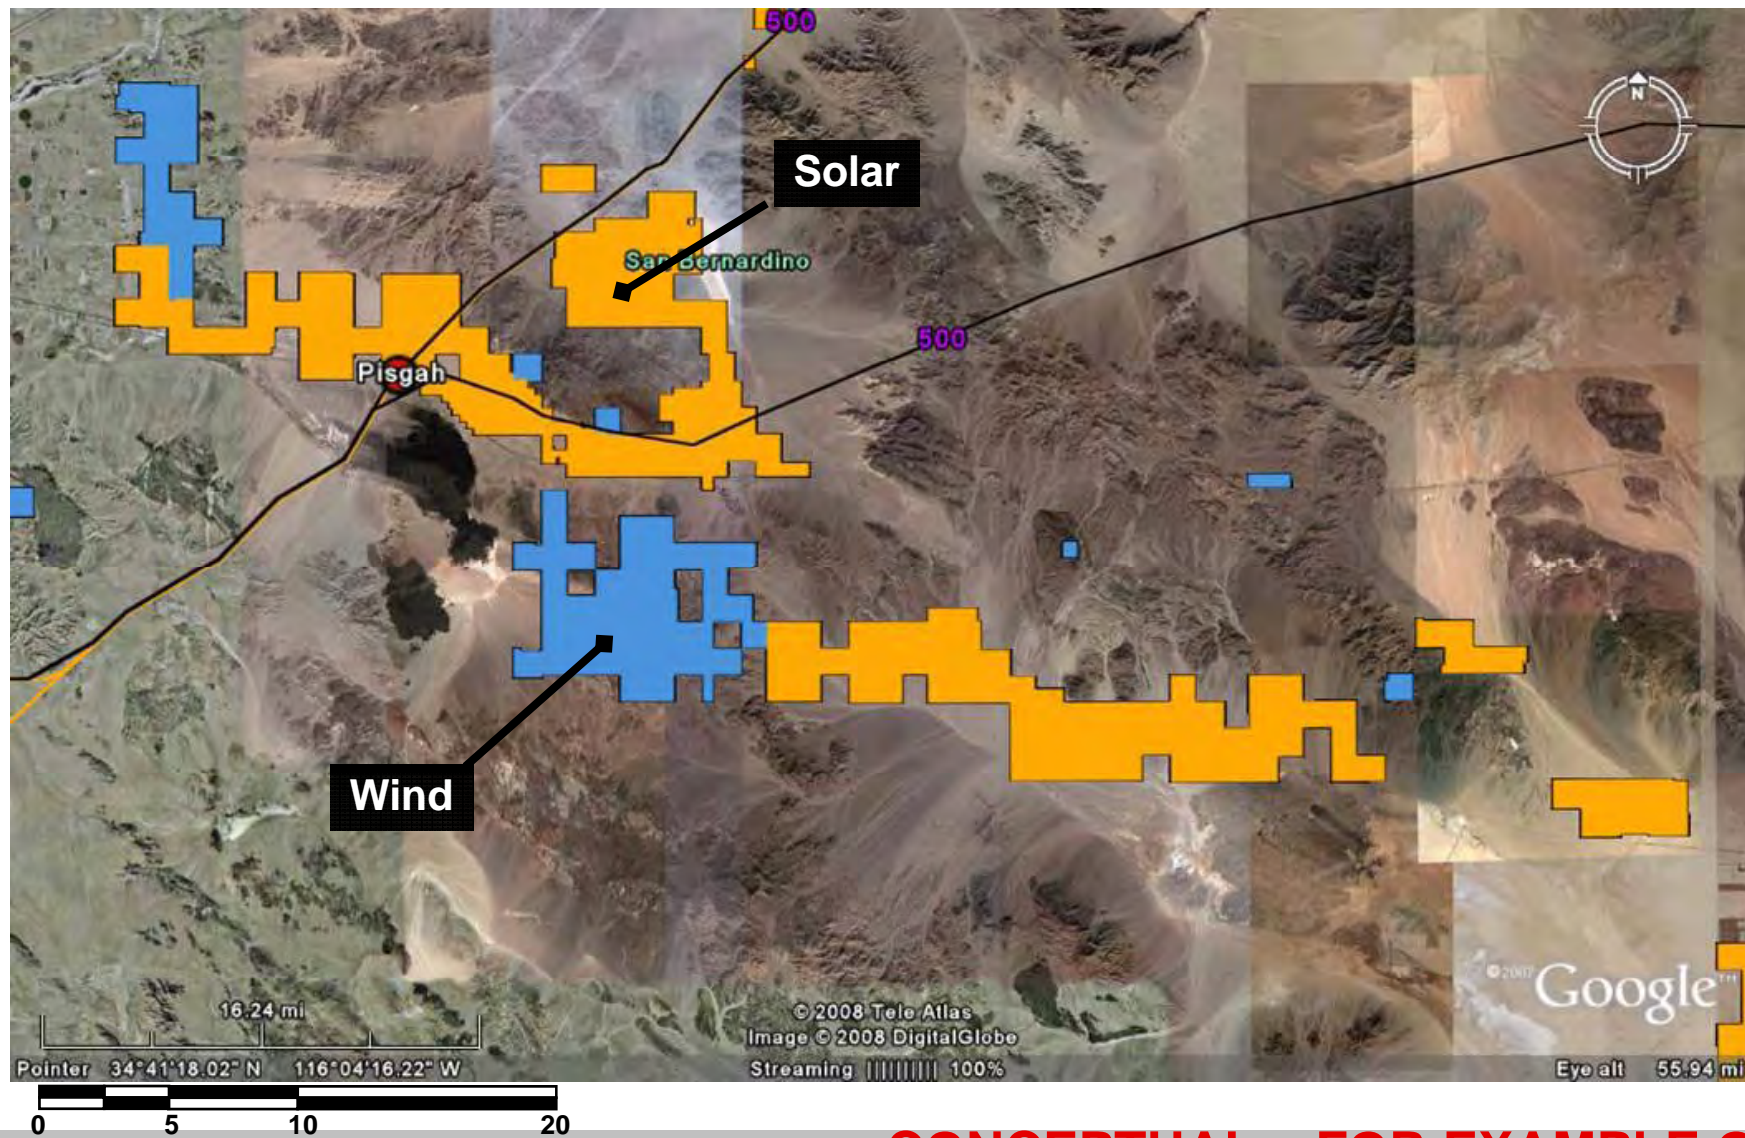

## Example Project Identification for Pisgah

- Hypothetical Supra-CREZ around Pisgah
- Wind and solar resources
- This example was created to explain process before we started the actual project ID, which is currently in process

## Pre-Identified Projects (Partial)

## Development Timeframe

- Near term: before 2013
- Mid term: 2013-2016
- Long term: 2017-2020

## Development Timeframe Linked to Transmission

| Transmission Timing   | Timeframe  | Project Type   |                |
|-----------------------|------------|----------------|----------------|
|                       |            | Pre-Identified | Proxy Projects |
| Existing Transmission | N/A        | near           | near           |
| Approved Transmission | 2009-2012* | near           | mid            |
| Proposed Transmission | 2013-2016* | mid            | mid            |
| New Transmission      | 2017-2020  | long           | long           |

\* Timeframe assignment is typical. Will vary depending on specific transmission project timing

## “Approved” Transmission (RETI Base Case)

- Tehachapi 1-3
- Tehachapi 4-11
- Sunrise Powerlink
- Devers – Palo Verde 2
- IID - Dixieland
- IID - Midway-Bannister

## Proposed Transmission

- TANC Projects
  - Alpha
  - Zeta
- PG&E
  - Central California Clean Energy Transmission
  - BC Link
- IID - PV-Yuma
- IID - CV – Devers
- Etc.

## New Transmission

- All other not-identified
- Other regional transmission links
